

Homomorphic Matrix Computation & Application to Neural Networks

Xiaoqian Jiang, Miran Kim (University of Texas, Health Science Center at Houston)

Kristin Lauter (Microsoft Research), **Yongsoo Song** (University of California, San Diego)

Background

Primitives for Secure Computation

❑ Differential Privacy

- Limited Applications (e.g. count, average). Privacy budget.

❑ (Secure) Multi-Party Computation

- Lower complexity, but higher communication costs.

e.g. 40GB for GWAS analysis for 100K individuals [Nature Biotechnology'17]

- Protocol has many rounds.

❑ (Fully) Homomorphic Encryption

- Higher complexity, but less communication costs.
- One round protocol.

HE vs. MPC

	Homomorphic Encryption	Multi-Party Computation
Re-usability	High (non-interactive) One-time encryption No further interaction from the data owners	Single-use encryption Not good for long-term storage Interaction between parties each time
Sources	Unlimited	Limited participants (due to complexity constraints)
Speed	Slow in computation (but can speed-up using SIMD)	Slow in communication (due to large circuit to be exchanged)

HE is ideal for long term storage and non-interactive computation

Summary of Progresses

- ❑ 2009-10: Plausibility
 - [GH'11] A single bit operation takes 30 minutes.
- ❑ 2011-12: Real Circuits
 - [GHS'12] A 30,000-gate in 36 hours
- ❑ 2013-16: Usability
 - HElib [HS'14]: IBM's open-source implementation of the BGV scheme
The same 30,000-gate in 4-15 minutes
- ❑ 2017-Today: Practical uses for real-world applications
 - HE Standardization workshops
 - iDASH Privacy & Security competition (2013~)

Secure Health Data Analysis

Predicting Heart Attack

- ~0.2 seconds.

Sequence matching

- ~27 seconds, Edit distance of length 8.
- ~180 seconds, Approximate edit distance of length 10K (iDASH'15)

Searching of Biomarkers

- ~0.2 seconds, 100K database (iDASH'16)

Training Logistic Regression Model

- ~7 minutes, 18 features * 1600 samples (iDASH'17)

Homomorphic Matrix Operation

- ❑ HElib (Crypto'14)
 - (Matrix) * (Vector)
- ❑ CryptoNets (ICML'16)
 - (Plain matrix) * (Element-wisely encrypted vector)
- ❑ GAZELLE (Usenix Security'18)
 - (Column-wisely encrypted matrix) * (Plain vector)
- ❑ Homomorphic Evaluation of (Deep) Neural Networks
 - [BMMP17] Evaluation of discretized DNN, [CWM+17] Classification on DNN.
 - Evaluation of Plain model on Encrypted data.

Homomorphic Matrix Operation

❑ HElib (Crypto'14)

- (Matrix) * (Vector)

$O(d)$ complexity for (matrix*vector).
→ $O(d^2)$ for (matrix*matrix): not optimal.

❑ CryptoNets (ICML'16)

- (Plain matrix) * (Element-wisely encrypted vector)

❑ GAZELLE (Usenix Security'18)

- (Column-wisely encrypted matrix) * (Plain vector)

❑ Homomorphic Evaluation of (Deep) Neural Networks

- [BMMP17] Evaluation of discretized DNN, [CWM+17] Classification on DNN.
- Evaluation of Plain model on Encrypted data.

Motivation

- ❑ Scenarios (Data/Model owner; Cloud server; Individuals)
 - I. Data owner trains a model and makes it available on the cloud.
 - II. Model provider encrypts a trained model & uploads it to the cloud to make predictions on encrypted inputs from individuals.
 - III. Cloud trains a model on encrypted data and uses it to make predictions on new encrypted inputs.

- ❑ Our Work: Homomorphic Operations between Encrypted Matrices

Main Idea

Functionality of HE Schemes

□ Packing Method

- Vector encryption & Parallel operations.
- $\text{Enc}(x_1, \dots, x_n) * \text{Enc}(y_1, \dots, y_n) = \text{Enc}(x_1 * y_1, \dots, x_n * y_n)$

Functionality of HE Schemes

□ Packing Method

- Vector encryption & Parallel operations.
- $\text{Enc}(x_1, \dots, x_n) * \text{Enc}(y_1, \dots, y_n) = \text{Enc}(x_1 * y_1, \dots, x_n * y_n)$

□ Scalar Multiplication

- $(a_1, \dots, a_n) * \text{Enc}(x_1, \dots, x_n) = \text{Enc}(a_1 x_1, \dots, a_n x_n)$

□ Rotation

- $\text{Enc}(x_1, \dots, x_n) \rightarrow \text{Enc}(x_2, \dots, x_n, x_1)$

Functionality of HE Schemes

❑ Packing Method

- Vector encryption & Parallel operations.
- $\text{Enc}(x_1, \dots, x_n) * \text{Enc}(y_1, \dots, y_n) = \text{Enc}(x_1 * y_1, \dots, x_n * y_n)$

❑ Scalar Multiplication

- $(a_1, \dots, a_n) * \text{Enc}(x_1, \dots, x_n) = \text{Enc}(a_1 x_1, \dots, a_n x_n)$

❑ Rotation

- $\text{Enc}(x_1, \dots, x_n) \rightarrow \text{Enc}(x_2, \dots, x_n, x_1)$

❑ Composition of basic operations

- Permutation, linear transformation (Expensive)

How to Represent Matrix Arithmetic
Using HE-Friendly Operations?

Matrix Encoding

- Identify $n=d^2$ dimensional vector to $d*d$ matrix
 - Addition is easy.

1	2	3

Matrix Multiplication

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}, B = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$$

$$AB = A_0 \odot B_0 + A_1 \odot B_1 + A_2 \odot B_2$$

\odot : Element-wise Multiplication

$$\begin{bmatrix} 1 & 2 & 3 \\ 5 & 6 & 4 \\ 9 & 7 & 8 \end{bmatrix} \odot \begin{bmatrix} a & e & i \\ d & h & c \\ g & b & f \end{bmatrix} + \begin{bmatrix} 2 & 3 & 1 \\ 6 & 4 & 5 \\ 7 & 8 & 9 \end{bmatrix} \odot \begin{bmatrix} d & h & c \\ g & b & f \\ a & e & i \end{bmatrix} + \begin{bmatrix} 3 & 1 & 2 \\ 4 & 5 & 6 \\ 8 & 9 & 7 \end{bmatrix} \odot \begin{bmatrix} g & b & f \\ a & e & i \\ d & h & c \end{bmatrix}$$

Matrix Mult = Generation of A_i, B_i & d-homomorphic add/mult.

Matrix Multiplication

$$A = \begin{array}{|c|c|c|} \hline 1 & 2 & 3 \\ \hline 4 & 5 & 6 \\ \hline 7 & 8 & 9 \\ \hline \end{array}, B = \begin{array}{|c|c|c|} \hline a & b & c \\ \hline d & e & f \\ \hline g & h & i \\ \hline \end{array}$$

$$AB = A_0 \odot B_0 + A_1 \odot B_1 + A_2 \odot B_2$$

\odot : Element-wise Multiplication

$$\begin{array}{|c|c|c|} \hline 1 & 2 & 3 \\ \hline 5 & 6 & 4 \\ \hline 9 & 7 & 8 \\ \hline \end{array} \odot \begin{array}{|c|c|c|} \hline a & e & i \\ \hline d & h & c \\ \hline g & b & f \\ \hline \end{array} + \begin{array}{|c|c|c|} \hline 2 & 3 & 1 \\ \hline 6 & 4 & 5 \\ \hline 7 & 8 & 9 \\ \hline \end{array} \odot \begin{array}{|c|c|c|} \hline d & h & c \\ \hline g & b & f \\ \hline a & e & i \\ \hline \end{array} + \begin{array}{|c|c|c|} \hline 3 & 1 & 2 \\ \hline 4 & 5 & 6 \\ \hline 8 & 9 & 7 \\ \hline \end{array} \odot \begin{array}{|c|c|c|} \hline g & b & f \\ \hline a & e & i \\ \hline d & h & c \\ \hline \end{array}$$

Matrix Mult = Generation of A_i, B_i & d-homomorphic add/mult.

Matrix Multiplication

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix}, B = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$$

$$AB = A_0 \odot B_0 + A_1 \odot B_1 + A_2 \odot B_2$$

\odot : Element-wise Multiplication

$$\begin{bmatrix} 1 & 2 & 3 \\ 5 & 6 & 4 \\ 9 & 7 & 8 \end{bmatrix} \odot \begin{bmatrix} a & e & i \\ d & h & c \\ g & b & f \end{bmatrix} + \begin{bmatrix} 2 & 3 & 1 \\ 6 & 4 & 5 \\ 7 & 8 & 9 \end{bmatrix} \odot \begin{bmatrix} d & h & c \\ g & b & f \\ a & e & i \end{bmatrix} + \begin{bmatrix} 3 & 1 & 2 \\ 4 & 5 & 6 \\ 8 & 9 & 7 \end{bmatrix} \odot \begin{bmatrix} g & b & f \\ a & e & i \\ d & h & c \end{bmatrix}$$

Matrix Mult = Generation of A_i, B_i & d-homomorphic add/mult.

Generation of A_i

$$A =$$

1	2	3
4	5	6
7	8	9

$$A_0 =$$

1	2	3
5	6	4
9	7	8

$$A_1 =$$

2	3	1
6	4	5
7	8	9

$$A_2 =$$

3	1	2
4	5	6
8	9	7

A_0 Generation : $O(d)$ homomorphic operations.

$A_i = \text{ColumnShifting}(A_0, i) : O(1)$ for each.

Generation of B_i

$B =$

a	b	c
d	e	f
g	h	i

$B_0 =$

a	e	i
d	h	c
g	b	f

$B_1 =$

d	h	c
g	b	f
a	e	i

$B_2 =$

g	b	f
a	e	i
d	h	c

B_0 Generation : $O(d)$ homomorphic operations.

$B_i = \text{RowShifting}(B_0, i) : O(l)$ for each.

Summary

$A, B : d * d$ matrices

$$AB = A_0 \odot B_0 + A_1 \odot B_1 + \dots + A_{d-1} \odot B_{d-1}$$

Generation of A_0, B_0 : General permutation - $O(d)$.

Generation of A_i, B_i 's: Column/Row shifting from A_0, B_0 - $O(d)$.

Element-wise product and summation: $O(d)$.

Total complexity: $O(d)$ homomorphic operations (optimal?).

Depth: 2 (scalar mult) + 1 (homo mult).

Other Operations

❑ Matrix Transposition

- Complexity $O(d^{0.5})$ + Depth 1.

❑ Parallelization

- When the number of plaintext slots $> d^2$.
- Encrypt several matrices in a single ciphertext.

❑ Multiplication between Non-square Matrices

Implementation

Experimental Results

Dim	Throughput	Message size	Expansion rate	Encoding+ Encryption	Decoding+ Decryption	Relative time per matrix
